

Pagination

Our list APIs (for example "**List offer requests**" or "**List airports**") will only return a limited number of results at a time.

By default, we'll return 50 results per page, but you can set this to any number between 1 and 200 with the `?limit` querystring parameter (for example by making a request to <https://api.duffel.com/air/airports?limit=200>).

At the end of every list response, you'll see a `meta` object:

JSON

```
{
  "meta": {
    "after": "g2wAAAACbQAAABBBZXJvbWlzdC1LaGFya2l2bQAAAB=",
    "before": null,
    "limit": 50
  }
}
```

If `meta.after` is `null`, then there are no more results to see.

But if `meta.after` isn't `null`, then that means there are more results "over the page".

To look beyond this first page of results, you'll need to use our cursor-based pagination functionality.

To see the next page, make a request to the same URL, but this time, add `?after=${meta.after}` to the URL - so in this case, we'd add `?after=g2wAAAACbQAAABBBZXJvbWlzdC1LaGFya2l2bQAAAB=`. You'll then see the next 50 results.

To see all of the results, repeat this process until `meta.after` is `null`.

Need some help?

We all do sometimes; code is hard.
